

**Assessment plan for the curriculum of the
Master's degree programme
in
Biomedical Engineering
Curriculum 2026/2027**

Programme director: Dr. J. (Jelmer) Sjollema

Date advice Board of Examiners: May 2026

Date approval Faculty Board:

1. Vision on assessment

1. Assessment should evaluate the students ability to apply knowledge, make judgments, and communicate in a professional way (both written and oral) with the aim to increase the quality of medical care and to decrease the cost and manpower, necessary for providing health care nowadays.
2. Assessment should enable qualification of a student to work in med-tech companies and (non-) academic hospitals
3. Assessment should enable qualification of a student to work in academic institutions to perform scientific research to new technologies that will contribute to more efficient health care and high quality of life
4. *Assessment as learning*: Assessment is part of the learning process to provide students feedback in their learning process.
 - a. Assessment involves both feedback and summative assessment.
 - b. Assessment is contextualized: this means that students receive feedback or are as much as possible tested in practical context-rich assignments.
 - c. Learning and developing competencies is often team-based. Peers as well as teachers and/or professional from the field are needed as a mirror, to conduct a discussion, develop new insights and to ask critical questions.
 - d. Problem solving and coping with problem solving tasks is seen as the core of the learning process.
5. Assessment should enable the evaluation of learning outcomes.

2. Assessment guidelines

1. Summative and formative assessment should be balanced in order to avoid “assessment steers learning” and stimulate internal motivation.
2. Formative assessment is primarily intended to provide feedback about the learning process and progress.
3. Written and oral deliverables should receive extensive feedback from the available staff. In case staff is unable to deliver this feedback, the use of such deliverables should be reconsidered.
4. Group projects/assignments allow for self-reflection and for intergroup summative assessment. Both of these enrich the academic learning process.

3. Learning outcomes of the degree programme

Learning Outcomes

At the end of the programme, the graduate is able to ...

1	Acquire expertise in Biomedical Engineering A Biomedical Engineer is able to continuously improve his/her expertise (knowledge and competences) by building on his/her thorough mastery of a specific field of biomedical engineering. This is demonstrated, not only by the Biomedical Engineer's ability to develop and apply new knowledge based on a critical reflection on standard knowledge but more so by increasing or adapting his/her competences by critically and independently reflecting on his/her own thinking, decision making, and acting.
2	Analyse the problem and define aim A Biomedical Engineer is able to analyse biomedical problems of a complex nature by choosing the appropriate level of abstraction and by critically examining existing theories, models or interpretations based on the assessment of the scientific value of current research within Biomedical Engineering. The Biomedical Engineer thereby creates a cause-effect model, distinguishes the problems that are fundamental and solvable and defines the aim which has the highest priority.
3	Create a Design, Research & Development proposal A Biomedical Engineer is able to design different strategies to obtain the defined aim, and has the skills in, and the affinity with the design, use and validation of models to allow the Biomedical Engineer to consciously choose the most efficient and effective Design, Research & Development plan.
4	Execute the Design, Research & Development plan A Biomedical Engineer is able to execute a Design, Research & Development plan and to adapt it when external circumstances or advancing insight requires it. Depending on the project the focus may be more on the scientific

	approach to increase knowledge and understanding (research), on prototyping and product improvement (development) or on the design of new devices or systems, although all three aspects are essential in the Design, Research & Development cycle of innovative products.
5	Analyse and interpret the data A Biomedical Engineer is able to ask adequate questions and has a critical, yet constructive attitude towards analysing and solving complex real-life biomedical problems. The Biomedical Engineer is able to form a well-reasoned opinion in the case of incomplete or irrelevant data; is able to analyse and interpret the results of Design, Research & Development in terms of statistics, limitations and the relation to existing literature and devices aiming to contribute to the advancement of knowledge in his or her field of Biomedical Engineering and beyond it.
6	Communicate results A Biomedical Engineer, as an interdisciplinary specialist, is able to communicate orally and in writing about Design, Research & Development with colleagues, non-colleagues and other involved parties including health care providers and patients. In addition, the Biomedical Engineer is able to debate about both Biomedical Engineering and the place of Biomedical Engineering in society.
7	Embed the results in scientific and social context A Biomedical Engineer is able to analyse and to discuss the social consequences (economic, social, cultural) of new developments in Biomedical Engineering with colleagues and non-colleagues; has insight into (debates about) scientific practice and is able to analyse and to discuss the ethical and the normative aspects of the consequences and assumptions of the scientific practice with colleagues and non-colleagues and is able to integrate these ethical and normative aspects in its own work.
8	Demonstrate a professional attitude A Biomedical Engineer is able to incorporate the knowledge, skills and competences described above and demonstrates a professional attitude by showing a high level of independence, responsibility and commitment. In addition, the Biomedical Engineer shows social skills as well as the ability to improve after feedback.

4. Overview of assessment methods, test moments for course units, and examiners

There is a distinction between BME course examiner (Table 4.1) and a Project examiner (Table 4.2) within the Biomedical Engineering programme.

4.1. BME Course examiner

Course examiners are appointed by the Board of Examiners as first or second course examiner. A BME course examiner is part of the curriculum of the Master's and/or Bachelor's Biomedical Engineering programme (see Table 4.1).

4.2. Project examiner

Project examiners are appointed by the Board of Examiners based on supervised Internships and/or Master's projects in recent years (Table 4.2). Project examiners only assess Internship and/or the Master's projects and will act next to a BME examiner. The BME examiner will always have the final say on the assessment of the Internship/Master's project. Internal and External Biomedical Engineering projects will be assessed by at least one BME course examiner. Internal projects carried out at the University of Groningen or UMCG will be assessed by (at least one) BME course examiner. The other examiner can be a Project examiner from the approved BME list (Table 4.2) or from the central FSE examiner list.

There are two kinds of external projects; 1) at accredited universities or University hospitals (UMC's), and 2) at companies or regular hospitals.

- 1) External projects carried out at accredited universities and UMC's will be assessed by a BME course examiner as a first examiner, and by a scientific staff member from the hosting university/UMC as a second examiner. If this examiner is not on the examiners list, they have to be approved by the Board of Examiners at least 4 weeks before the start of the project.
- 2) External projects carried out at companies, regular hospitals or abroad will always be assessed by two BME course examiners.
