Movement, cognition and underlying brain functioning in children

Irene van der Fels

The studies described in this thesis have been conducted at the Center for Human Movement Sciences, part of the University Medical Center Groningen and the University of Groningen, the Netherlands and at the Vrije Universiteit Amsterdam, Clinical Neuropsychology Section, The Netherlands.

This study was financially supported by the Netherlands Initiative for Education Research (NRO), grant number 405-15-410, and the Dutch Brain Foundation, grant number GH 2015-3-01. PhD training was facilitated by the Research Institute Science in Healthy Ageing and healthcaRE (SHARE), part of the Graduate School for Medical Sciences.

Printing of this thesis was financially supported by:

Table of contents

Chapter 1	General introduction	9
Chapter 2	The relationship between motor skills and cognitive skills in 4-16-year-old typically developing children: A systematic review	21
Chapter 3	Relations between gross motor skills and executive functions, controlling for the role of information processing and lapses of attention in 8-10-year-old children	55
Chapter 4	Relations between gross motor skills, cardiovascular fitness and visuospatial working memory-related brain activation in 8-10-year-old children	75
Chapter 5	The acute effects of two physical activity types in physical education on response inhibition and lapses of attention in children aged 8-10 years: A cluster randomized controlled trial	99
Chapter 6	Effects of aerobic and cognitively engaging physical activity on cardiovascular fitness and gross motor skills in primary school children: A cluster randomized controlled trial	123
Chapter 7	Differential effects of aerobic versus cognitively engaging physical activity on children's visuospatial working memory-related brain activation: A cluster randomized controlled trial	141
Chapter 8	Summary and general discussion	175
