Experimental determination of the $J^\pi$ components of the spin-dipole resonance in $^{12}\text{B}$
This work has been performed as part of the research program of the “Stichting voor Fundamenteel Onderzoek der Materie” (FOM), which is financially supported by the “Nederlandse Organisatie voor Wetenschappelijk Onderzoek” (NWO).

Experimental determination of the $J^\pi$
components of the spin-dipole resonance in
$^{12}\text{B}$

Proefschrift

ter verkrijging van het doctoraat in de
Wiskunde en Natuurwetenschappen
aan de Rijksuniversiteit Groningen
op gezag van de
Rector Magnificus, dr. F. Zwarts,
in het openbaar te verdedigen op
vrijdag 16 januari 2004
om 16.00 uur

doors

Marc Alexander de Huu
genomen op 26 april 1974
te Schlieren, Zwitserland
Promotor: Prof. dr. M.N. Harakeh
Co-promotores: Dr. A.M. van den Berg
               Dr. H.J. Wörtche

Beoordelingscommissie: Prof. dr. M. Fujiwara
                        Prof. dr. S. Galès
                        Prof. dr. C. Wilkin
Contents

1 Introduction .......................................................... 1

2 Polarisation formalism .................................................. 5
  2.1 The density matrix ............................................... 5
  2.2 Representation in spherical tensors ............................ 6
  2.3 Rotation of the density matrix .................................. 7
  2.4 Coordinate systems ............................................... 9
  2.5 The scattering matrix ............................................. 10
  2.6 Polarisation observables for the A(\bar{a},b)B reaction ........ 10
  2.7 Measurement of analysing powers .............................. 11

3 Theory ..................................................................... 15
  3.1 The effective nucleon interaction ............................... 15
  3.2 Spin-isospin excitations ......................................... 17
  3.3 The spin-dipole resonance (SDR) ............................... 20
    3.3.1 Status of the SDR search .................................. 20
  3.4 The (d,\bar{2}\text{He}) reaction ................................... 22
    3.4.1 (n-p)-type reactions ...................................... 22
    3.4.2 Measuring the (d,\bar{2}\text{He}) reaction .................. 23
    3.4.3 Selectivity of the reaction ................................. 23
    3.4.4 DWBA treatment of the reaction ......................... 23
    3.4.5 Symmetry of the transition amplitude ................. 26
    3.4.6 Polarisation observables ................................. 26

4 Experimental method .................................................... 29
  4.1 Beam production .................................................. 29
    4.1.1 The polarised-ion source ................................ 30
  4.2 The in-beam polarimeter ......................................... 32
4.2.1 Formulae to determine the polarisation of a beam of spin-1 particles ........................................... 34
4.2.2 The beam polarisation .................................. 36
4.3 The Big-Bite Spectrometer .................................. 37
  4.3.1 Ray-tracing ............................................. 39
  4.3.2 Recoil corrections ....................................... 40
  4.3.3 Sieve-slit measurements ................................ 40
4.4 Detector systems ............................................. 44
  4.4.1 Focal-plane detection system ......................... 44
  4.4.2 Focal-plane polarimeter ................................ 46
  4.4.3 Scintillators ........................................... 47
  4.4.4 Neutron detectors (EDEN) ............................ 47
4.5 Electronics .................................................... 49
  4.5.1 Front-end electronics .................................. 50
  4.5.2 Trigger logic ............................................ 50
  4.5.3 Online event processing ............................... 53
  4.5.4 Data acquisition ....................................... 54
  4.5.5 Online analysis and visualisation .................. 54

5 Analysis ........................................................................ 57
  5.1 Experimental procedure .................................. 57
  5.2 FPDS analysis ............................................... 58
    5.2.1 Focal-plane coordinates .............................. 58
    5.2.2 Target coordinates ................................... 58
    5.2.3 $^3$He variables ....................................... 59
    5.2.4 Background subtraction .............................. 59
    5.2.5 Energy calibration .................................... 61
  5.3 EDEN analysis ............................................... 62
    5.3.1 Kinetic energy determination ....................... 62
    5.3.2 Prompt-random subtraction .......................... 63
    5.3.3 Detection efficiency .................................. 63
    5.3.4 Final-state spectrum .................................. 65
  5.4 $^3$He-acceptance correction ............................. 66
    5.4.1 Simulation procedure ................................. 66
    5.4.2 Reliability and accuracy ............................. 68
  5.5 Cross sections and tensor-analysing powers .......... 69
6 Results
6.1 General aspects of the data .................................................. 75
   6.1.1 Quasi-free background .............................................. 76
   6.1.2 Singles data .......................................................... 78
   6.1.3 Coincidence data ..................................................... 81
6.2 Low-lying strength .......................................................... 85
   6.2.1 Peak-fitting procedure .............................................. 85
   6.2.2 Semi-microscopic calculations ................................... 87
   6.2.3 Cross sections and tensor-analysing powers ..................... 88
   6.2.4 Bin-wise analysis ..................................................... 92
6.3 High-lying strength .......................................................... 94
   6.3.1 Singles data .......................................................... 94
   6.3.2 Coincidence data ..................................................... 95
6.4 Decomposition of the SDR .................................................. 98

7 Conclusions and outlook ..................................................... 101

A Relation between spherical and cartesian tensors ............... 103
   A.1 Spin-1 angular momentum operators .............................. 103
   A.2 Spherical tensors ...................................................... 103
      A.2.1 Tensor of order 0 ................................................. 104
      A.2.2 Tensor of order 1 ................................................. 104
      A.2.3 Tensor of order 2 ................................................. 105
   A.3 Cartesian tensors ...................................................... 105

B Detailed trigger scheme ..................................................... 109

Bibliography ............................................................................ 111

Samenvatting ........................................................................... 119

Dankwoord .............................................................................. 123
