More than four years ago I have started my Ph.D. research in the Atomic Physics group in Groningen. From my side, the choice to do so was motivated not only by the attractive project, a combination of atomic and surface physics, but also by the good ‘vibe’ that I felt while touring the Atomic Physics lab. As it turned out, my instinct was right: the good atmosphere within the group has ensured a pleasant working experience.

First and foremost, I would like to thank my promotors, Ronnie Hoekstra and Reinhard Morgenstern, for the pleasant and fruitful collaboration. Ronnie is a vast source of wisdom to be tapped when you need to overcome all kind of possible problems that you can encounter in the Atomic Physics lab. His door was always open when I had a question about physics. Ronnie just found the best balance between guiding me and giving me enough independence in my research. I am grateful to Reinhard for his ability to put complicated physics into a strikingly clear picture. By keeping a broad view on my research, Reinhard would sometimes, with a simple remark, help me see the forest from the trees.

I would like to thank Danyal Winters, my predecessor at the surface physics set-up, for the great job done in building the set-up and writing the data acquisition software, as well for the guidance in the early stages of my project. Without his contribution, I would have spent much more time overcoming technical hurdles instead of focusing on physics. Working with Danyal was always great fun, due to his excellent sense of humor.

I am grateful to Abel Robin for learning me a lot of ‘dirty tricks’ from the world of ion-surface collisions. I enjoyed a lot our work together, which span for almost the whole duration of my Ph.D. research. Abel is a great colleague to travel with, we have quite some memories from the conferences where we went together.

I had the chance to work with a few undergraduate students who have chosen (wisely) to do their research projects at Surphyn’. Jos Postma did a great job in finding the right parameters for the polarization analysis system. I enjoyed
working with Jos because he has the trademark Surphyn’ sense of humor, and we shared the passion for senseless First Person Shooter (FPS) computer games. I will never forget those Unreal Tournament nights at KVI... I would also like to thank Erwin Bodewits for the extensive help he provided me while doing my final magnetite experiments, a time when he seemed to give up chasing the trampoline effect. Erwin too possesses the Surphyn’ sense of humor, a character trait that has probably pushed him to continue working at the surface physics set-up on a Ph.D. research project. Erwin, lots of luck in the future! Rachid el Yahyaoui helped on improving the soft-iron yoke design by running Femlab simulations, while Corien Prins did a good job in finding growth recipes for magnetite films and analyzing the LEIS spectra from the iron oxide films we’ve grown.

I would also like to thank prof. Dirk van der Marel, who gave me the opportunity of doing my Master research in the group of Optical Solid State Physics. Many thanks to Hajo Molegraaf, my supervisor during that time, who helped me see the wonders of experimental physics. I always enjoy recalling the nights that we spent in the lab, measuring those high-$T_c$ superconducting crystals. During those nights I have learned that the sweetest sleep happens in an armchair, waiting for a spectrum to be completed.

I am grateful to the KVI technical staff for their support. Thanks to the mechanical workshop team, not only for building set-up components, but also for letting me borrow some highly specialized tools when I needed them. I would also like to acknowledge the help of the KVI electronic department. Many thanks to Hans Vorenholt and Martin Stokroos, for their help on different problems I had with the Surphyn’ electronics, as well with the Sairem R.F. generator. As Surphyn’ is an UHV set-up, I of course needed the help of the vacuum department. Jalke Wieringa was very helpful with all fore-pump related issues, while Henk Gorter took care of the turbo pumps. I also enjoyed a lot the time spent with the KVI football team under the coaching of Henk.

None of the results in this thesis would be possible without the ECRIS ion source, therefore I am grateful to Jan Mulder for his assistance in troubleshooting the source. Also, during the time when the R.F. generator of out ATF ECRIS has burned down, Harm Post and Jan-Willem Mekkering were of great help in making the R.F. generator of the AGOR ECRIS work for us. I wouldn’t have succeeded in getting my last measurements on magnetite done without their help in overriding the AGOR ECRIS interlocks.

I would also like to thank the IT group at KVI for their support, especially Jakko van der Weele, Roel Alkema and Alfred Felzel, who made sure that I didn’t see the blue screen of death too often. Thanks to Alfred also for organizing the LAN party’s at KVI, they helped a lot in venting some of the inevitable frustration which piles up while you’re working on finalizing your Ph.D. project. The personnel and financial departments were very helpful in ensuring a little bit of
order in the chaotic work style of a physicist. Also, Amarins Petitiaux made life easier by being so prompt and efficient in arranging my work-related travelling.

I am grateful to the members of my thesis reading committee, prof. Petra Rudolf (University of Groningen), prof. Rob Timmermans (KVI Groningen) and prof. Helmut Winter (Humboldt University Berlin), for the careful reading of the manuscript and for the very useful comments and suggestions.

Now it’s the time to thank all the people who have ensured that I was in good spirits, which of course increased my productivity. Many thanks to my colleagues from the ‘ATF and fans’, with whom I had a great time, at work and beyond: Danyal Winters, Steven Hoekstra, Steven Knoop, Abel Robin, Fresia Alvarado, Dennis and Erwin Bodewits, Albert Mollema, Thomas Schlathölter, Gabriel Hasan, Sadia Bari, Dang Minh Hong and Umakanth Dammalapati. My friends made sure that I did not have the typical social life of a physicist: Mişu, Szili, Dan, Alex, Csaba, Magda, Adi, Ramona, Oana M., Marius, Cristina, Robert, Oana J., Odi, Irina, Vali, Lăcrămioara, Andrei, Diana, Mihai, Aurora, Gabiţa, Danijela, Saša, Andrija, and the list could go on and on...

Nicoleta, thank you for being my ‘practical genius’ and for showing me what happiness really is.
