This research was supported by the Commission of the European Communities, Director General for DG XII Science, Research and Development, Biomed 2 Program PL-972726.

Publication of this thesis was financially supported by the Graduate School for Behavioral, Cognitive and Neurosciences and ResQ Lab BV.

Aan een ieder die hier wat aan heeft.
Chapter 1 Clinical motivation and scope of the thesis ........................................ 9
  1.1. Clinical motivation to monitor metabolites ........................................ 10
  1.2. Requirements device for continuous in vivo monitoring ..................... 12
  1.3. Technical motivation for the set-up of the in vivo monitoring device ...... 13
  1.4. Aims and scope of the thesis ...................................................... 18
  1.5. References ................................................................................... 20

Chapter 2 Theoretical aspects ............................................................... 23
  2.1. The Biosensor .............................................................................. 24
    2.1.1. Definitions and classification .................................................. 24
    2.1.2. History of the development of enzyme-based amperometric biosensors 27
    2.1.3. Theoretical aspects of amperometric biosensors ....................... 32
  2.2. Sampling .................................................................................... 37
    2.2.1. Introduction .......................................................................... 37
    2.2.2. Continuous on-line sampling ................................................ 38
  2.3. References ................................................................................... 43

Chapter 3 Biosensor device and Ultrafiltration Sampling for Continuous in vivo Monitoring of glucose ......................................................... 47
  3.1. Introduction ................................................................................. 48
  3.2. Materials and Methods ............................................................... 49
    3.2.1. Materials .............................................................................. 49
    3.2.2. Methods .............................................................................. 49
  3.3. Results and discussion ............................................................... 50
  3.4. Comments on biomedical applications ........................................... 53
  3.5. References ................................................................................... 53

Chapter 4 A versatile biosensor device for continuous biomedical monitoring ......................................................... 55
  4.1. Introduction ................................................................................. 56
  4.2. Experimental section ............................................................... 58
    4.2.1. Apparatus .............................................................................. 58
    4.2.2. Materials .............................................................................. 59
    4.2.3. Procedures ............................................................................ 60
  4.3. Results and discussion ............................................................... 61
    4.3.1. Testing of the permselective membrane .................................. 61
    4.3.2. Construction of the miniaturised biosensor ............................. 63
    4.3.3. Introduction of the permselective membrane ......................... 65
    4.3.4. Performance characteristics of the syringe pump ................. 67
    4.3.5. Biomedical applications ....................................................... 69
  4.4. Conclusions ................................................................................ 70
  4.5. References ................................................................................... 71

Chapter 5 On-line continuous monitoring of glucose and lactate by ultraslow microdialysis combined with a flow-through nanoliter biosensor based on poly(m-phenylenediamine) ultra-thin polymer membrane as enzyme electrode ................................................................. 73
  5.1. Introduction ................................................................................. 74
  5.2. Experimental ............................................................................. 77
    5.2.1. Materials and solutions ........................................................ 77
    5.2.2. The flow-through cell ........................................................... 77
5.2.3. The permselective membrane ................................................. 77
5.2.4. Measurements by means of Flow Injection Analysis (FIA) .......... 78
5.2.5. Measurements in the continuous mode .................................... 78
5.2.6. Electron microscopy .......................................................... 79
5.2.7. Attenuated Total Reflection Fourier Transform Infrared (ATR-FTIR)
command ................................................................. 79
5.3. Results .................................................................................. 79
5.3.1. Construction of the miniaturised flow-through cell ................. 79
5.3.2. Production of the miniaturised flow-through cell ................. 80
5.3.3. Polymer formation of poly(phenylenediamine) films for use in
biosensors ............................................................................... 80
5.3.4. Dynamic range of the poly(m-phenylenediamine) based biosensor .. 82
5.3.5. Enzyme immobilisation ...................................................... 84
5.3.6. Selectivity of the biosensor .................................................. 84
5.3.7. The stability of the glucose biosensor .................................... 85
5.3.8. Performance characteristics of the lactate biosensor ............ 88
5.3.9. Applications ..................................................................... 89
5.4. Conclusion ........................................................................... 90
5.5. References ........................................................................... 91

Chapter 6  Covalent immobilisation of enzymes throughout a
poly(m-phenylenediamine) ultra-thin polymer membrane for the
production of stable flow-through nanoliter biosensors .................. 93
6.1. Introduction ............................................................................ 94
6.2. Experimental ......................................................................... 97
  6.2.1. Materials and solutions ................................................... 97
  6.2.2. The flow-through cell ..................................................... 98
  6.2.3. The permselective membrane ........................................... 98
  6.2.4. Measurements in the continuous mode ............................. 99
  6.2.5. Measurements by Flow Injection Analysis (FIA) .............. 99
  6.2.6. Attenuated Total Reflection Fourier Transform Infrared (ATR-FTIR)
command ................................................................. 100
  6.2.7. Ultrafiltration catheter ................................................... 100
  6.2.8. In vivo experiments ......................................................... 100
6.3. Results and discussion .......................................................... 101
6.4. Conclusion ........................................................................... 108
6.5. References ........................................................................... 108

Chapter 7  A lightweight measuring device for the continuous in vivo
monitoring of glucose by means of ultraslow microdialysis in combination with a
miniaturized flow-through biosensor ........................................ 111
7.1. Introduction ............................................................................ 112
7.2. Materials and methods .......................................................... 114
  7.2.1. Materials .......................................................... 114
  7.2.2. Production of the flow-through biosensor ....................... 115
  7.2.3. Testing of the flow-through biosensor by means of Flow Injection
Analysis ........................................................................... 116
  7.2.4. A lightweight measuring device for the continuous monitoring of
glucose .............................................................................. 116
  7.2.5. Oral glucose tolerance test (OGTT) .................................. 117
7.3. Results and discussion .......................................................... 118
7.3.1. Performance characteristics ............................................. 118

Contents
Chapter 8 Twenty-four hours profiling of glucose in the subcutaneous tissue of healthy volunteers by means of a lightweight portable measuring device.

Chapter 9 Turnover of extracellular glucose and lactate in the rat striatum estimated by equilibrium microdialysis and sensor technology.
