Thanks!!!!

Did you enjoy reading this book? Then you should know that I could have not achieved any part of it without other people. Some of them are co-authors of the chapters, others are acknowledged at the end of each chapter. Finally, others are never mentioned throughout the chapters.

I will start with the biggest emotional support, the one that usually you see at the end. I would like to thank my fiancée, Dr Tim W. Fawcett. His contribution to this book was essential. He has been there with me from even before the start of the project, when I had to choose whether to embark on it or not, to the middle, with ups and downs, till the very end, making the .tiff figures on Saturday evening, and advising me on what to wear at the defense. Let alone all the corrections to the English and to the statistical analyses. Thank you, Tim! Knowing that you were there all the time made it possible.

I am really thankful to the thesis promotor, Prof Jaap M. Koolhaas, and the co-promotor, Dr Sietse F. de Boer. I was very lucky to work with them, and I hope I have at least gained a minimum part of their knowledge and “scientific wisdom”.

A big thank to Dr Claudio Carere, my “mentor”. We don't really have one at the University of Groningen, but I think if I had to choose one, he would be my mentor. His collaborative and enthusiastic attitude resulted in extra projects that are not mentioned in my thesis in the field of neuroendocrinology of personality.

Thanks to the paronymfen: Deepa Natarajan and Ilir Haxhi for their great help and friendship through these years. With Deepa I shared the lab and the project of mouse aggression. Many concepts and ideas mentioned in this thesis come from discussions with her and her thesis, which I strongly recommend, is complementary to this one. Ilir is a great friend and his social skills and expertise in business and economics make him an ideal support in going through the organization of the defense.

Thanks to the whole Animal Physiology department, which, I know, it does not exist officially, as everybody keeps saying, but it exists in the feeling of the people of the department. It is a really vibrant corridor, the D-first floor. In particular, Bauke, Anne, Caroline, Deepa, José, Giulia, Alinde, Ramon, Auke, Riejanne, have been great colleagues in the Behavioural Physiology group. I am really thankful to the old PhD crew: Amalia, Anghel, Robbert, Viktor, Angelique, Izabella, Aniek. As well as to the new one: Arianna, Caroline, Nikoletta, Girstaute, Ivi, Marcelo, Roelina, Henriette, Timur, Paulien, Simon, Gretha, Stefano and Peter. I am really
thankful to the technical personnel: Jan K. and Jan B., especially. I am very thankful to the administrative personnel: Henk, Joke and Pleunie. I am very thankful to the senior academic staff of the department: Anton Scheurink, Gert-Jan van Dijk, Jan Strubbe, Ingrid Nijholt, Paul Luiten, Uli Eisel, Eddy van der Zee and Peter Meerlo. I enjoyed their welcoming attitude, their will to discuss and help interpreting data in any moment of the day.

Many thanks also to the Electron Microscopy unit at the Medical Faculty. I am really thankful to Han van der Want, Henk de Weerd and everybody that was so nice and helpful with me in their lab, leading to the realization of chapter 8.

Thanks to Han de Vries, from University Utrecht. His contribution has been so quick and mainly through email, but it led up to a major part of the thesis (see chapter 3).

Thanks to the reading committee and to the defense committee for taking their time and showing such interest in this thesis.

Thanks for Bachelor and Master Students that participated at this project. In particular, a big thank to Cees, Chris, Dirk-Jan, and Jan S.

Thanks to Dick Visser for the last-moment layout.

Thanks to the BCN for funding all those courses, activities and conferences, in particular thanks to Diana Koopmans and Britta Küst.

Thanks to the RuG and to the FWN for funding the scholarship and in particular thanks to Anneke Toxopeus for sorting out all the tax problems derived from the confusion between the two different types of PhD students: bursalen and AIO’s.

Thanks to the Theoretical Biology group, led by Prof. Franjo Weissing, for being so welcoming and scientifically stimulating and thanks to all his students and colleagues, in particular Daan, Ido, Max, Bram, Ana, and Liliana.

Thanks to Irene Mateo-Leach, Magdalena Kozielska, Aitana Peire, Antonella Pellicoro, Marian Comas, Nikolaus von Engelhardt, Delphine Theard, Teresa Gonzalo; Barbara Feldmeyer and Giorgio Barbareschi for being such good friends and for teaching me how to get through a PhD successfully.

Thanks to all the other friends and colleagues from the Biology center, and to all the friends outside biology, from the music ensembles and from Italy.

Un ringraziamento particolare alla mia famiglia. Grazie papà, Luisa, Stefania e Riccardo per essere stati così comprensivi e generosi in questi lunghi quattro anni lontano da casa.

Grazie!!!!
