Acknowledgements

Ever since I was a child I always wanted to study abroad and have a look at the other side of the world. I would like to thank my promotors Prof. dr. Anke van den Berg and Prof. dr. Sibrand Poppema for giving me this wonderful opportunity to undertake the PhD study in the University of Groningen. Being a PhD student of Prof. dr. Anke van den Berg is lucky. She is well organized, consistent and has a strong sense of logical thinking. She is result oriented and I appreciate her very much for tolerating my ultra-flexible working schedule. To have Prof. dr. Sibrand Poppema be my promotor is an honor. His insights for research are always precise and together with his pleasant personality he set a very good example to me about how one can be in the research field. I would like to thank Dr. Bart-Jan Kroesen for being my co-promotor. His patience and support are highly appreciated. Also, thank you Prof. dr. Ralf Küppers, Prof. dr. Leendert H.J. Looijenga and Prof. dr. Steven T. Pals for spending their valuable time to read my thesis.

A heart felt thank you to all my colleagues who work(ed) in the “miRNA team” because without them I may not be happily finishing up my PhD study on time. Tjasso showed me the survival skills when I first join the team, including cloning, cell culture, qRT-PCR, staining, a little bit of Dutch, where the free cake is and when not to show up in the lab as it is the holiday; Rikst Nynke gave me her bike, showed me how Risotto and a real windmill look like, listen to my whining and becomes one of my paranimfen. Debora, Geert, Johan and Nancy demonstrated to me that men of principle who are consistent at the same time can be very friendly, nice and productive. The massive amount of work shown in Chapter 2 and 4 of my thesis can barely indicate how hard they had worked.

A very special thank to people in the Malignant Lymphoma and Hematology groups, including Miao, Jan-Lukas and Lydia. Without discussions and sharing from Miao, I would not have come up with my Chapter 2 and 3. Without her enthusiastic stories and go-getter attitude my time in Groningen can be less interesting. Thank you Jan-Lukas for letting me take the second author position and push him to third (in Miao’s paper, my chapter 3), I will never forget this. His easy going attitude, attempts to
crack a joke on almost every occasion and kind act of being one of my paranimfen are highly treasured. Lydia, thank you for always being helpful and offered me food, cakes, advices, laughter and more.

I would like to say thank you in particular to my co-authors. Thank you Arjan and Prof. Dr. Philin Kluin for spending their valuable time to look at the slides I had stained. Thank you Erwin and Dr. Ody Sibon from the Department of Cell Biology as their help in the bioinformatic analysis massively reduce my workload with the computer. Without Erwin quick response to the demanded work I would have been still glued to the computer now analyzing tons of data one by one. Without Gerben and Dr. Klaas Kok from the Department of Genetics my microarray work would not have been performed smoothly. Thank you Stefano Rosati, Rogier M Reijmers, Menno K Dijkstra, Kirsten van Lom, Mars B van t'Veer, Mojca Jongen-Lavrencic, Peter Möller and Enrico Tiacci for contributing their work and time to make our articles published.

A big thank you to all colleagues in the DNA and O&O lab for letting me have this unforgettable experience working in the lab, especially: Klaas who always likes to throw me some Dutch words to test my poor tiny Dutch vocabulary but nonetheless always being supportive; Sippie who allows PhD students to bug her with tones of in situ hybridization related matters but still has very huge patience limit; Sicco who is cool at times but can be hilarious with jokes; Lorian who is simply pleasant to talk to; Inge who is cool, calm and steady; Jane who tolerated my monopoly of the water bath tank with grace; Marnix who took his time and showed me Western blotting, Theo who once let me exploit on his ever precious angiotensin receptor antibody, Marjan and Tineke who helped with the sectioning of tissue blocks, Wouter who lent me his Supersignal solution for Western blotting, Mirjam who gave me some fluorescence antibody for FACS, Rianne who was patience with me working around her area causing mess sometimes, and Hans who was always helpful whenever I have doubts.

Thank you Joost, Çiğdem, Mirjam, Richard, Callista, Chuan-Hui, Iza, HuangXin, Pytrick and Kasha. I really appreciate the time we spent together for serious discussions, advices, jokes and nonsense talking. Thank you Roel for being so
helpful whenever I have problems with the computer. Thank you Hans for his patience and help with the FACS. Thank you Harry for being a wonderful student who can deliver output. Thank you secretaries of the Department of Pathology for being helpful and efficient.

Thank you Leong Keat Chan who influenced me to switch major to Biochemistry during my BSc study in the USA, my interest in research did not begin until I was exposed to it during the course of this program. Thank you Dr. Te-Chung Lee who taught me to run the first PAGE and Dr. Sajitra Sinha who paid me during the summer of 2002 for internship and showed me how freestyle research can be. During my time in his lab, I learned not to afraid of making mistake, breaking the glassware, and realize how important it is to focus on problem solving. The biochemical methods I practiced during these days prepared me to tackle with the lab work shown in Chapter 6. Thank you Dr. Patricia Lim who offered me my first job and was so kind to turn the research project into a master student’s work. Thank you Prof. dr. Suat-Cheng Peh for the guidance during my MSc study and for recommending me to apply for the PhD study.

Thank you grandpa who used to carry me with his gigantic bicycle to the kindergarten. Thank you my dearest mother who made me read every morning during my primary school years. Thank you my dearest father who insisted that all his children should study abroad as he was not given the opportunity to do so back in his olden days. Thank you my sister Lu Jia for selflessly offering me her laptop and camera when I go study abroad, my sister Lu Yi for keeping my homesick stomach sustained with her food blog, my youngest sister Lu Think for being you, my elder brother Yan Ke for not turning off the wireless modem when I was writing the thesis midnight at home and last but not least, Mr. Hoong Tat Hiew for his ten times journey to the Netherlands during my three and a half years PhD study in Groningen.
