This thesis concludes nearly six years of research at the physics of nanodevices group, University of Groningen, The Netherlands. It started in 2009, when I joined the group as a master’s student. Over these years, I have worked with several brilliant individuals whose direct or indirect support and contributions carved me into the person I am today. I also had the privilege to work in an impressive research institute—the Zernike institute for advanced materials. I want to therefore start by thanking the Zernike institute for financing my master’s study in Nanoscience. Having arrived in the Netherlands late August 2008 to attend a similar program at TuDelft, I had too much on my plate too soon when I pondered on switching to another program in Groningen. In the end, I am glad that I chose to come to Groningen and learned the preparation, characterization, and properties of functional nanomaterials. For that, I have to thank both Dr. Koos Mars and professor Paul van Loosdrecht for arranging the admission interview just a week before the start of the program.

Next, I would like to thank my thesis supervisor Prof. van Wees, first, for giving me the opportunity to join your group for a master’s project in graphene spintronics and, later, for putting your trust in me to continue my PhD research in the EU-funded project MACALO. When you asked me to switch to a different topic for my PhD and join the metallic spintronics team, I gladly accepted knowing that I would turn out fine under your supervision, and I was right. Your analytical skills, deep understanding of the physics and swift ability to pinpoint mistakes are very admirable. I appreciate the freedom you give your students to explore several research directions. Now, I leave the group with great confidence after having gained a lot of expertise in electrical, thermal and spin transport studies.

Dear professors Günter Reiss, Thom Palstra and Joseph Heremans, thank you very much for being part of the assessment committee and for your valuable comments which improved the final presentation of the results. I hope, in the future, to get the opportunity to thank you in person.
I would like to extend my acknowledgment to our technical staff—Johan, Bernard, Martijn, Herman and Anna. You guys made sure that everything ran smoothly in the group. Knowing that both technical and organizational issues would be taken care of meant that we could focus fully on our research. Although we take credit for the research, your effort, behind the scenes, is never under-appreciated and I am thankful for that.

Dear Tamalika, thank you very much for your suggestions and comments both on my research as well as my career choices. Caspar, although our interactions were few and far between, the discussions we had about parenting and athletics were very entertaining. I wish both of you good luck in your future research.

When I initially joined the group as a master’s student, Thomas was my daily supervisor. Thomas, thank you for explaining the basics of electrical measurements. Together with Csaba I couldn’t ask for better supervisors during that time. Thank you also for sharing the amazing photos of our daughter that you took when you visited us. I wish you and Marta a happy future together and my heartiest congratulations already on your marriage!

Dear Joost, when I started my PhD you were already few months into your PhD and, at that time, you already setup the recipe for the fabrication of the pillar spin valves, which formed the basis for my research. You are among one of the most gifted experimental physicists I know. Although you chose to move away from academia, I am sure that you will be a success in ULTS. I have learned a great deal from you and your help in translating the summary chapter of the thesis is truly appreciated. Together with Frank, you explained me the finite element simulation and nanofabrication techniques for the metallic nanostructures. Frank, I do appreciate your simplistic and organized approach to problems and it is a skill I always tried and continue to make a habit for myself.

Former colleagues and soccer team mates, Bram and Sergey, thank you both for introducing me to BeQuick football club and for being entertaining during training and games. I wish you both best of lucks in your future life and career at ASML.

Nynke and Juan, I am glad and thankful that you agreed to be my paranymphs. Nynke, although we started collaborating only in the last year of my PhD, it came at a time when I needed more help in wrapping up the spin valve on YIG paper after we learned that somebody has already scooped us. With your help we managed to publish the paper on the same journal as the paper before us and I am really glad that it worked out well. I also thank you for your openness to listen to my remarks about equipment failures and having them fixed in no time. Dear Juan and Lei, the scientist couples, thank you very much for your polite way of communication and for your hospitality. Juan, over the past two years, I had the pleasure of working with you. Although I wish I had more time to finish-up our Peltier paper, I am sure that
you will make a good story out of it and become successful in whatever you choose
to do after your PhD. I wish both of you best of lucks in your PhD and future career.

Ivan, thank you for getting me involved in the graphene thermoelectrics research.
Since the time you joined the group, I have learned a great deal from you about
experimental and modeling techniques. You are a talented physicist with a great
enthusiasm and interest in other’s research, which is among one of the qualities
required to succeed in academia. Your involvement with many PhD projects in the
group signifies the desire you have to explain and understand the physics involved.
My project was not an exception—starting from our spin heat results to the latest
work in graphene. Until now, I have not come across with a person who not only
knows the ins and outs of the electrical measurement setups but also measures as
meticulously as you do. Thank you also for the stimulating Skype meetings and for
reading and commenting on my papers. I am grateful that I have worked with you
and wish you all the best in Manchester.

I would like to also thank the current metallic spintronics team: Kumar (good luck
with your curved membranes and with Ivan, I am sure, you will have a successful PhD),
Ludo (thank you for explaining the QTLab. I am sure that the future will be very exciting
for you both in research and outside. I wish you all the best in your PhD and I am sure that
you will be a perfect dad), Jing (good luck with your proposal; hopefully you stay in the team
and, for the first time, make sure that girls outnumber the boys.) and Aisha (our envoy in
building 18, thank you for your help on the SQUID and low temperature measurements with
the PPMS setup, Good luck with the remaining two years of your PhD).

To current and former colleagues and friends at FND—I thank you all for making
my stay in Groningen very pleasant. Jean-Paul (for helping me at the start of my PhD),
Alina (for suggesting to join FND and later proposing the few layer graphene project.),
Marcos (for the help during low temperature measurements and on our few layer graphene
paper), Vincent (for your friendly help in moving our stuff and for the gifts from you and
Chantal.), Eek (for several entertaining discussions about job hunting and parenting. Good
luck at your new job in Océ!), Paul (for being a cool office mate and for being there to
answer questions specially when I had EBL issues. Good luck with finishing up your thesis.),
Jasper (for the many office discussions in our thermoelectric papers and also for motivating
proposition 5, wish you all the best in finishing up your thesis!), Sander K. (for your scientific
input in the three-terminal measurements we did with Nilesh), Dani (It was a shock for all of
us to hear about your accident but you have so far shown great strength and I wish you that
you have a speedy recovery and comeback stronger), Magda (for sharing your Hanle model.
Congratulations for landing a job at Shell, you deserve it.), Saurabh (for help with AFM
measurements and for being friendly all the time. I wish you all the best in finishing up your
PhD and finding a job) and finally Nilesh. Niesh, I was glad when you approached
me for a master’s project. You joined me on a difficult project where we explored
several three-terminal devices. Although you mastered the experimental techniques relatively faster, the difficulty of the project, I am afraid, contributed for your switch to optics. I am glad that I have worked with you and it is also great to see that you are enjoying your PhD research by combining both electrical and optical measurements. Wish you all the best and hopefully will see you in Germany. I would like also thank other group members with whom I have shared a lot of birthday and paper cakes: Goraya, Sebastien, Juliane, Dirk, Eric, Alexey, Juliana, Malik, Sid, Roald, Pep, Olger, Christian, Sander O., Arramel, Alok, Morten, Sid, Juliana, Gaurav, Subir, Geert, Xu, Arjit, Rick and Urvashi.

Outside work, I have to thank a lot of friends who made my stay in the Netherlands very special and enjoyable. My fellow Ethiopian friends, Bikia & Belaine (for the memorable times together!), Wende & Hareg, Eyob, Tame & Rozi (Thank you for your hospitality whenever we visited.), Fentaw & Abu (for all the good times and delicious meals together), Fitse, Wende, Sol, Bini, Abdi, Yohannes & Asmeret, Hana, Yeshambel, Esube, Paul, Mequanint. I have learned many things from you all—from silly political debates to unforgettable dinner and drinks. My Iranian friends, Reza, Hiwa, Davood & Zohreh for the delicious Iranian foods and for your availability to discuss openly about life, research and career choices. I wish you all the best in your future career.

I would like to express my deepest gratitude to my parents–Eta & Abaye–from early age you instilled in me the importance of education and provided me with everything so I could focus on my education. Thank you for the sacrifices you have made for the better future of you kids and this thesis is dedicated to you. My second parents, Genete, mimi and Aba, I always felt welcome at your home and the fact that you left your house open every time we wanted to visit made my life so much easier. I can not thank you enough for all the help and support over these years. My dear brother and sisters—Dimi, Tame, Mahdi, Hirute and Zeubti—I have fond memories of our childhood and all the silly things we did together. I have nothing but respect to all of you and I cant thank you enough for the respect you also show to me & Blen.

Finally, I reserve a special place for S@ye and Lis—my girls, who make my day, help me redefine my perspectives in life and prioritize things. S@ye qonjo, although I may not have been around as much as I (you) would have liked in the last couple of months, you were always nothing but spectacularly supportive and caring and I am out of words to express how lucky I am to have you in my and Lis’ life. Your help in correcting my writing was also very much appreciated. This thesis is therefore dedicated to you. Now that it is finished, I am sure that it is going to get better and I can’t wait for us to have a fresh start in Halle (Saale), Germany.

Fasil Kidane Dejene
