Acknowledgements

Some say that writing a PhD thesis is a life’s work. Mine took luckily only a few years and I have to thank many people for that.

Firstly, I want to thank my great promoters, prof. dr. Ritsert Jansen and prof. dr. Bert de Brock, for giving me the position for a PhD project at the newborn Groningen Bioinformatics Center (GBIC). Ritsert, you learned me to be as efficient and elegant in writing publications as I am in writing software code, and were always available to help me push for the highest goals while seeking interactions with others, inside and outside science. Bert, you provided me with the conceptual foundations for my work and with deep software engineering discussions not possible in the bioinformatics group, under the adagium ‘reality is often more crazy than imagination’. I also thank the thesis reading committee, Hans Wortmann, Frank Holstege en Jacques Leunissen, for their comments and suggestions.

Secondly, I want to thank my software engineers who helped to slay the many little devils of my software development projects (as well as other projects). I especially want to thank my best friend Alrik Lubbers who helped me to lay the difficult foundation of a ‘better’ MOLGENIS and who, even in his current job, helped me a lot in lively discussions on the best architectures and the other issues of life ;-) over a glass of good wine. I also want to thank Richard Scheltema who now may become a PhD student himself (?), Dewi Matthijssen who kindly stayed for another year to help me beyond her BSc project as a software engineer, and Gonzalo Vera who helped me to bridge data to processing (a new chapter that we just opened).

Thirdly, I want to thank all my other colleagues at GBIC for the fruitful discussions and good ‘coffee’ times, especially my roommate Martijn Dijkstra for your energizing support and discussions during our thesis preparations and intense discussions on the ‘theory of household item physics and economics’; Klazien Offens for the organizational and administrative support; Peter Terpstra for my first course on bioinformatics; Bruno Tesson for sharing the struggle of developing a consensus data structure for genetical genomics; Yingyuan Fu and Yang Li for our recent collaborations on genetical genomics processing tools, and Tauqueer Alam, Casper Albers, Rainer Breitling, Menno Hardonk, Siem Heisterkamp, Frank Johannes, Gerard te Meerman, Jan-Peter Nap, Stephen Nyangoma, and Theo Reijmers. I also want to thank my students Steffan Jacobs and Joeri van der Velde, and his other supervisor Ate Boerema, for their valuable input to bring my biological software infrastructures efforts to the next level.

Fourthly, I want to thank my many other collaborators in order of appearance. I thank the molecular genetics group of the University of Groningen for introducing me to the turbulent world of (bacterial) life sciences and for kindly housing me when the GBIC did not have its
own place in the Hartman-wing of the biological center yet, especially Evert-Jan Blom, Dinne Bosman and Kim Susanna for our good times in our little ‘broom closet’, and Anne de Jong, Sacha van Hijum, Girbe Buist, Richard Baerends, Jan Kok en Oscar Kuipers for working on the first MOLGENIS ‘for microbes’. I thank the members of the EU-BioGrid consortium for widening my view beyond Groningen, learning a lot about the many different biological data resources, and to experience the interesting project management dynamics of an international project under the European Commission, especially Alan Robinson for his three-day visit to discuss ‘what do biologists really want to have’ and Michael Schroeder, Alexander Kozlenkov, Dimitrios Vogziatis and Panos Dafos for several workshops discussing smart frameworks to make all this resources work together. I thank my collaborators at Genetwister B.V., the medical genetics department of the University of Groningen and ASG Lelystad for their collaboration during the pilot study of ‘whether the first MOLGENIS could be easily adapted to human, animal and plant research’ (as it turned out: yes, which fused a desire for generators for even more features), especially Simon Langeveld, Rob Luiken, Frans Gerbens, Edo Plantinga, Krista Kooi, Frank Harders, Hinri Kerstens, Marco Pool, en Luc Janss,. I thank my collaborators on my one year side project (not in this thesis) where we asked ourselves the question ‘how can we make a business for MOLGENIS such that we get the money to move forward more quickly’ especially Siert Bruins, Jurjen Helmus, Riet Grevelink and Jornt van Dijk. I thank my collaborators at the Trial Coordination Center of the University Medical Center Groningen for the interesting quest for a uniform ‘meta’ base to store all medical studies of the hospital, now and in the future, especially Stefan van Oosten, Hans Hillege, Marco Assman, Nic Veeger, Andrea de Winter and René Oostergo. And I thank my current collaborators in the EU-CASIMIR consortium, especially my former GBIC colleague Rudi Alberts and Klaus Schughart for hosting me in Braunschweig, and Damian Smedley, Glenn Proctor, Katy Wolstencroft, Carol Goble, Dawn Muddyman and Paul Schofield for the technical discussions on mouse data integration.

Finally and foremost, I want to thank my family die mij geholpen hebben om te komen waar ik nu ben. Bedankt pap en mam dat jullie me zo goed voorbereid de wijde wereld in hebben gestuurd en mijn voorafgaande studie mede mogelijk hebben gemaakt. Bedankt Koos, Lars & Sjoukje, Niels, Anke, Jurjen, Eline & Maurice, Joke, Jan, Anne-Marleen & Erik, Matthijs, tante Joke, en tante Simone voor de gezellige bijeenkomsten die zorgden dat er meer is dan werk. En ik dank vooral mijn lieve vrouw Francien die ervoor gezorgd heeft dat ik mezelf niet geheel verloor in mijn onderzoek: ‘je kunt ook op tijd zijn voor het eten en daarna thuis verder werken’. Dank dat je me bent blijven steunen tijdens dit wetenschappelijke ‘projectje’ en voor je hulp in het leesbaarder maken van de tekst!

Morris Swertz  
Groningen, 10th of January 2008
