Acknowledgements

A PhD is a relatively long period of study and research in which one lays the basis for his/her future career. It surely takes a personal effort to achieve the title, but the contribution and help of many people are generally necessary to reach the goal, and it’s not by chance that all PhD theses finish with a long list of acknowledgements.

There are many people who have contributed, in different ways, to make these four years of life and research in Groningen four successful, beautiful years. The first in the list is of course my supervisor and mentor Petra Rudolf, to whom I would like to express my gratitude for the opportunities she has created for me and for her care, patience and intelligence, for individuating what I am best at and for giving me the time to build other skills and both professional and non-professional qualities which I still had to develop when I started my PhD.

There are many people whom I worked with and to whom I am indebted. I thank Luc Venema and Arend Heeres for all their help with the lab equipment and teaching me how to make the best out of experimental work. Still on the “experimental side” I wish to thank Andrea Goldoni, Luca Petaccia, Carla Castellarin-Cudia and Paolo Vilmercati, together with the rest of the staff of the Surface Division of Elettra in Trieste, for their valuable support during several synchrotron beamtimes. I gratefully acknowledge the user support group of the MAXlab II synchrotron in Lund, and Lisbeth Kjeldgaard and Joachim Schiessling, for their invaluable help without which I wouldn’t have been able to complete successfully my “Swedish” beamtimes.

I’d like to express my gratitude to Andrea Goldoni, Luca Petaccia, and Paul Brühwiler for the continuous and helpful discussions of the data and of the analysis presented in this thesis. I also want to express my deep appreciation to Joachim Schiessling, who at the very beginning of my PhD taught me a lot of things that proved essential lessons, from how to be consistent in synchrotron experiments and data analysis, to how to survive in and make the best out of the world of research. I wish him all the best for the future.

I am grateful to Renate and Sonja for their help with all kinds of bureaucratic and everyday needs. Many thanks to Giovanni Bertoni for his contribution to two papers. A special thank you goes also to Thijs Hollink and Michiel Donker for the Dutch translation of the synopsis and summary of this thesis, and to Gijsbert Rispens for proof-reading them.
I’m very grateful to the members of the reading committee, Paul Brühwiler, Ronnie Hoekstra and Mark Golden, for their constructive comments which helped improve the quality of this thesis.

It has been a pleasure to collaborate with other groups of the Zernike Institute in the course of these four years, and I hope there will be other chances to work together again. I enjoyed a very fruitful collaboration with the Theoretical Chemistry group, in particular with Ria Broer, Javier Luzon and Aymeric Sadoc. I am grateful to Maxim Mostovoy for giving wonderful lectures and for answering all my physics questions both inside and outside the classroom. I thank Paul van Loosdrecht and Daniele Fausti for the numerous physics discussions we had, and for their enthusiasm for optics, which has played a part in my decision to move to a new field of research after my PhD.

It has been fun to work side by side with many young scientists: to spend my working and non-working hours in the company of Fabrizio, Sandra, Regis, Yu, Luminita, Tatiana, Xiaonan, Enrico, Tullio, Imad, Dimitris, Monika, Marcella, Fabien, Darja, Rene, Thijs and Ymkje, to work with and supervise Rebecca Savage and Junjun Shan in their master’s thesis, and to be part of a very international group of friends. I want to mention here, besides the whole Surfaces & Thin Films group: the Italian bunch whose improvised meetings in the corridors of the Zernike Institute are now famous as the “family-“,”mafia-“ or “spaghetti-reunions” (Daniele, Filippo, Alessio, Damiano, Fabrizio: you were there); the young staff of the Optical Condensed Matter Physics group, with whom I drank many a friendly Dutch beer; and the various friends that I made during my sport- and night-life in Groningen.

Last but not least, a very warm thank you to my family and friends who have followed my adventure from afar, in Italy or scattered across Europe: thanks for always being there. And to Michela, for sticking to me in good and bad times, for “spicing up” my life (so that I’m never bored, nor rested), and for her precious help with the formatting of the thesis.

Roberto
