**General remarks:** All air and moisture sensitive manipulations were carried out under a dry nitrogen atmosphere using standard Schlenk techniques. $^1$H-NMR, $^{31}$P-NMR, and $^{13}$C-NMR spectra were recorded on a Varian 400 (400, 162, and 101 MHz) in CDCl$_3$. Mass spectra (HRMS) were recorded on an AEI MS-902. Optical rotations were measured on a Schmidt and Haensch Polartronic MH8. Rh(acac)(C$_2$H$_4$)$_2$ was purchased from Strem and used without further purification. Dioxane was distilled from sodium. All other chemicals were purchased from Acros and used as received unless stated otherwise. Flash chromatography was performed using silica gel 60 Å (Merck, 230-400 mesh). Phosphoramidite ligands L$_1$ and L$_2$ were prepared according to literature procedures.

**Catalytic arylboronic acid addition reactions**

**General procedure for Table 1, entries 1-7.** In a flame dried Schlenk tube flushed with nitrogen, 1.55 mg (6.0 µmol, 3 mol%) of Rh(acac)(C$_2$H$_4$)$_2$ and 14.0 µmol (7.5 mol%) of one of the enantiomers of phosphoramidite L$_1$ were dissolved in 2 mL of solvent. After stirring for 15 min at room temperature, 0.2 mmol of substrate 1a and 0.6 mmol of phenylboronic acid (2a, 3 equiv) were added and the resulting mixture was stirred at reflux. After 4 h the reaction mixture was cooled to RT and quenched with 2 mL of a 12.5% aqueous ammonia solution. After 20 minutes the water-layer was extracted with 3 x 5 mL of ethylacetate, the combined organic layers dried on Na$_2$SO$_4$, and evaporated under reduced pressure.

**General procedure for Table 2, entries 1-11.** In a flame dried Schlenk tube flushed with nitrogen, 1.55 mg (6.0 µmol, 3 mol%) of Rh(acac)(C$_2$H$_4$)$_2$ and 6.5 µmol (3.5 mol%) phosphoramidite (S,S)-L$_2$ were dissolved in 2 mL of 2-propanol. After stirring for 15 min at room temperature, 0.2 mmol of substrate 1 and 0.6 mmol of arylboronic acid 2 (3 equiv) were added and the resulting mixture was stirred at reflux. After 4 h the reaction mixture was cooled to RT and evaporated under reduced pressure. Products were purified by flash chromatography (SiO$_2$, pentane:EtOAc = 20:1).

**(R)-(4-chlorophenyl)phenylmethanol (3a).** Obtained as a solid in 91% isolated yield (Table 2, entry 1); mp 47.4-48.4 °C; $^1$H NMR (CDCl$_3$) $\delta = 7.21$-$7.30$ (m, 9H), 5.75 (s, 1H), 2.11 (bs, 1H); $^{13}$C NMR

Identification of borate ester 4

In a flame dried Schlenk tube flushed with nitrogen, 1.55 mg (6.0 µmol, 3 mol%) of Rh(acac)(C2H4)2 and 14.0 µmol (7 mol%) of one of the enantiomers of phosphoramidite L1 were dissolved in 2 mL of dry dioxane. After stirring for 15 min at room temperature, 0.2 mmol of substrate 1a and 0.4 mmol of phenylboronic acid 2a (2 equiv) were added and the resulting mixture was stirred at reflux. After 4 h the reaction mixture was cooled to RT. The reaction mixture was passed through a silica-plug and the solvent evaporated under reduced pressure. According to 1H-NMR, a mixture was obtained of 9% starting material 1a, 36% product 3a, and 55% borate ester 4 with a characteristic benzhydrylic proton at 6.21 ppm. Negative ion ESI-MS using diluted NH3 (aq.) as a base, gave a specific isotope pattern for C13H11BO3−.NH3 (M-NH4+): m/z 277.1 (15%,
\( ^{10}\text{B},^{35}\text{Cl} \), 278.1 (100\%, \( ^{11}\text{B},^{35}\text{Cl} \), 279.0 (25\%, \( ^{10}\text{B},^{37}\text{Cl} \), 280.0 (25\%, \( ^{11}\text{B},^{37}\text{Cl} \). Usual work-up of the mixture with aqueous ammonia 12.5\% (\textit{vide supra}), followed by flash chromatography (SiO\(_2\), pentane:EtOAc = 20:1) gave the product 3 in 89\% isolated yield.
