Acknowledgements

Here comes the most difficult task: All things described in this thesis could not have been done, if not for the contribution of a lot of people. I will try to do my best (anyway, if one looks at my abysmal skills on this matter he/she will realize that doesn’t mean much) to make justice and give credit to all of them.

Let’s start with my promotors: Teun - Thank you for asking the unexpected question: “How about doing a Ph.D in my group?” It took me a few years to realize that saying yes was one of the wisest things I ever did. Your skills in dealing with people and not only with science, made my four years in Groningen very enjoyable. Bart: thank you for teaching me the importance of being critical in what you do. If I think differently now it’s mainly due to you.

Let me not forget the technical staff: first of all (in the increasing order of their height), Bernard ‘big bad’ Wolfs, cryogenics guru and impressively patient in cleaning the mess I tend to make around me. Next Siemon Bakker, clean-room boss and provider of practical pranks to keep you awake during coffee breaks and finally, Minte Mulder, the very quiet person behind the always working vacuum systems. Then, the Ph.D’s themselves: Jochem, the SEM … Master, without whose presence in the group many of the samples and measurements could not have been made. However, nobody’s perfect, and Jochem could certainly use some brush up of his Quake skills :-). Friso, whose always good mood was one of the most important ingredients in the cohesion of our group. I’ll skip any recommendation to Friso, he knows what he needs. Michele was my office-mate and I should fist apologize for keeping him in the dark for almost two years (unlike him, I like the blindfolds of the office windows closed). Then I can thank him for his patience in dealing with me and his stubbornness in trying to teach me electronics. In the end, I am grateful to Diana (to be more exact, the Serbian …) for doing the talking for the rest of us. I’ve been lucky to have wonderful students. I have great memories and I enjoyed talking to Derkjan, Emiel, Frank, and Alex.

In the four years I had a lot of interaction with people outside the lab. I should thank to all members of the SPIDER project, and especially to Jo de Boeck, the
project coordinator, for a fruitful collaboration. All the semiconductor experiments
could not have been performed if not for Staf Borghs who provided the 2DEG
materials. I am grateful to Georg Schmidt and Laurens Molenkamp for the very
useful discussions over the physics of spin injection.

I should thank the Romanian gang, without whom I wouldn’t have had much
of a life outside working hours. Too many to be named all, but let me make have
my picks: Alex ”the stupid guy” Macridin was a such a wonderful living example
of how thing shouldn’t be done, Liviu and Diana for a friendship I’m not 100%
sure I deserved and a care in feeding me that I will never understand. Bogdan
managed to share and an apartment with me (and he was even able to refrain from
smoking!). Catalin set the standard in our Romanian community on punctuality
and composure. Szili tried hard to teaching me table tennis (a few more years and
he might have succeeded). Gabi accepted to playing bridge and was pretty funny
(at least from time to time). Oana was always helpful (even when not asked) and
”Old man” Dan so meaningfully quiet.

Finally, a special thanks to Diana, my girlfriend: in her pathetism she managed
to change a lot of things in my life.

Thank you all.
