Acknowledgements

The work and preparations leading to a Ph.D. thesis do not begin on the day when one starts the official Ph.D. period in a research lab. The drive to actively seek answers to scientific questions, and the perseverance to complete projects that will provide those answers is built during one’s education on inherent qualities planted by parents in their children. Therefore, I must think of and thank my parents and family first, for surrounding and soaking me with their intellectual and critical attitude.

I always think with warm gratitude of my high school biology teacher Béla Gál, who chiseled our talents, made us think and gave the greatest biology classes in school, spiced with his slightly cynical remarks.

I would like to express my appreciation to Prof. Dr. Miklós Kedves, Head of the Laboratory of Palinology at the Department of Botany, University of Szeged, Hungary, who introduced me to lab life and scientific investigation, encouraged me to pursue my ambitions and gave me the first lessons on patience and perseverance.

Due to her radiating personality and wide scientific knowledge, Dr. Éva Fekete, assistant professor at the Department of Zoology and Cell Biology, University of Szeged, Hungary, channeled my attention towards the anatomy and physiology of the mammalian nervous system. I am deeply thankful to her for supporting me to grab opportunities like the TEMPUS student exchange program, to help my knowledge and experience grow. She has felt it always her own responsibility to bring the best out of her students, to help them find the most stimulating environment where their talents could unfold. Her positive influence has stayed with me to this day.

I am grateful to the TEMPUS Student Exchange Program between Western and Eastern European universities, and its coordinators Dr. Magdolna Szente at the University of Szeged, Hungary and Dr. Braum Kroon at the University of Groningen, The Netherlands for making my participation in the program possible and for arranging the conditions for the valuable undergraduate research in 1993-1994 at the Department of Animal Physiology in Groningen. The six months spent as a student in Groningen had a marked and defining influence on my future carrier in biology. I greatly appreciate the fine supervision of Dr. Frans W. Maes and Dr. Cerien Streefland during this period, the sweetness of my hostess Anneke Grol and the mental support of Prof. Dr. Béla Bohus, the Head of the department.

I would like to express my gratitude to Prof. Dr. Károly Gulya, Head of the Department of Zoology and Cell Biology, University of Szeged, Hungary, and all the other members of staff,
whose department always served as a firm “base” to me, and who constantly supported my scientific activities, no matter where they were taking place.

I am grateful to Prof. Dr. Arthur D. Loewy, who offered the opportunity to take my first scientific job as a Research Assistant in his lab in 1995-1997, at the Department of Anatomy and Neurobiology, Washington University School of Medicine, St. Louis, U.S.A., and to Dr. Arthur S.P. Jansen and his family for helping me settle in St. Louis and for supplying me with encouragement and scientific support. I have warm regard to Dr. Jian Liu, whose friendship has proved to be invaluable.

Finally, I highly esteem the contribution of the people who were actively involved in my Ph.D. project and in bringing it to the promotion. First of all, I am indebted to my promoter Prof. Dr. Paul G.M. Luiten, who felt personally responsible not only for the development of the project but also for the well being of “his Hungarian community”. His enthusiasm never ceased to read a new manuscript; he was always present with his finely packed opinion and did not fail to see the person behind the researcher. Special thanks to Dr. Rob A.I. de Vos at the Regional Laboratorium of Pathology in Enschede, The Netherlands, who tirelessly collected post-mortem brain samples for our collaboration, shared his deep knowledge and enthusiasm about neuropathology, kept a delightful company at conferences and amused us with his jokes. I appreciate the contribution of Dr. Ernst N.H. Jansen-Steur, the neurologist at Medisch Spectrum, Twente, Enschede, who evaluated the patients admitted in our studies. I would like to thank Dr. Gineke I. De Jong, who taught me the skills she had accumulated during her long years of research and left me, besides her expertise, considerable material to complete. I appreciate the technical assistance of Jan N. Keijser, the wizard of autoradiography and the Quantimet computer analysis system, Jan Gast, Jan Zagers, Klaas Sjollema and the staff of the Department of Animal Physiology, as well as the Laboratory of Electron Microscopy and Department of Microbiology. This work could not have been completed without the students, who participated in the project as part of their undergraduate education: Mike Zuurman, Annelies Klink, Johan Hettinga, Diana Wittendorp, Etelka Apró, Hilko Timmer, Marjolein Gerrits and Lianne Schuiling. The atmosphere at the department has always been warm and cozy, a perfect environment to work in, a nest for friendships. I will always remember the philosophical discussions with Nico Noorman, learning Dutch with Katalin Horváth, coping with Numico matters with Martijn de Wilde, walking on Schiermonnikoog with Alexa Veenema, solving computer puzzles with Jan Mulder, visiting Brugge and Lübeck with Tibor Harkány, playing squash with the guys and horse riding with Esther van de Wall. It has been not only hard work but also fun, thank you all!
