ACKNOWLEDGEMENTS

During the work on this PhD project, I received a lot of support, help, and advice from the people around me. I have been looking forward for a long time to this opportunity to thank everybody who has contributed to this dissertation.

First of all, I would like to thank my supervisor Reint Geuze. He guided me through all the steps of my project with great patience, and his sharp, deep way of thinking pushed my own insight steadily further.

My Doktorvater Paul van Geert provided creative criticism and helped me get a grip on my from time to time seemingly unmanageable data. His innovative view on developmental processes was a great inspiration to me and broadened my mind. I am deeply grateful to Anke Bouma, my second promotor, for many enlightening and fruitful discussions and her careful, critical comments on my manuscript.

Phillipa Butcher provided indispensable advice all along the way. I would like to thank her for sharing with me her incredible knowledge of early development and her experience with testing infants and for putting a new heart into me so many times.

I also thank Tom Snijders for introducing me to multilevel analysis and taking the time to help me with my models and to answer all my questions patiently.

When I traveled to the United States to learn more about eye-tracking with infants, I received a warm welcome there. I would like to thank Dick Aslin for his valuable advice and for being a member of my PhD committee. I am very grateful that I had the chance to visit his lab at the University of Rochester. During this time I learned a lot about eye-tracking and research with infants, particularly during the week I spent in the lab together with Bob McMurray, figuring out how to combine eye- and head-tracker in an experimental setup suitable for young infants. My thanks also go to Scott P. Johnson for helpful discussions and the opportunity to visit his lab at the time at Cornell University. I would also like to thank the two other members of the PhD committee, Addie Johnson and Geert Savelsbergh.

The financial support of the Graduate School of Behavioral and Cognitive Neurosciences (BCN) is also gratefully acknowledged.

Further, I would like to thank the pediatricians and neonatologists at the University Hospital Groningen (AZG) and the Martini Hospital (MZH), especially Arie Bos, Mar Zweens, Lily van Doormaal, and Albert Martijn for putting together the sample of preterm infants and providing their clinical data.

Working at the Department of Developmental and Experimental Clinical Psychology of the University of Groningen was a wonderful experience. I enjoyed the stimulating, cooperative atmosphere and felt very much at home. I would like to thank my colleagues for the interesting discussions and the gezellige Christmas lunches, department days out, and coffee breaks. Especially, I thank my fellow PhD students: Marijn van Dijk, Martine Verheul, Kitty Boosman, Cor van Halen, Els Blijd-Hoogewys, Norbert Boerger, Koen van Braeckel, Georgios Vleioras, Anna Lichtwark-Aschoff, Laura Ballato, Marieke Visser, Raphaela Carriere, Henderien Steenbeek (who shared the office and the daily
Acknowledgements

joy and sorrow with me), and Evelien Krikhaar (who taught me much more than my first words of Dutch and is by my side during the defense as my paranimf).

I am very grateful to the staff of the instrumentation service of the Psychology Department (IDP): Hans Veldman, Jan R. Smit, Edwin Kiers, Pieter Zandbergen, Joop Clots, Eise Hoekstra, Bas Kortman, and Peter Albronda. They provided structural support and were always willing to drop whatever they were doing to help in cases of emergency at the babylab.

I would also like to thank the students Ellin Simon, Thalia Albracht, Jenny Vogel, Lieke Drukker, Mieke van der Horn, and Femke Groen, who assisted during the measurement sessions, helped coding data, and set me thinking many times by asking tricky questions.

Also my new colleagues of the Psychology and Health Department at Tilburg University were very supportive during the last few months, and I would like to thank in particular Anneloes van Baar for her lively interest, understanding, and profound advice.

I owe a great debt of gratitude to the little infants who form the sample of this study and especially to their mothers and fathers. Without their trust, their enthusiasm, and their sustained cooperation this research would not have been possible. It was not always as easy to get in contact with parents and infants who could participate in my study, so I thank everybody who helped me find babies: midwives, child birth education teachers, acquaintances and friends. My thanks also go to the dependable people of the transportation service of the University of Groningen, who made sure that parents and infants were picked up on time to come to the lab and brought home safely after the measurement sessions.

I am very grateful to Dick Visser for designing the cover and the layout of this dissertation, and I also thank him and Marjolijn de Wijk for their warm hospitality.

I thank all my friends, far away or close by, for going through these years with me, for their interest in my research, but much more important, for their efforts to let me forget about it. I also would like to thank my family for all their sympathy and encouragement. Especially, I thank my parents for reading every chapter of this thesis I sent them with great interest, for correcting my German, and for their constant loving support during all this time.

And finally, there is Jacques Dane, who supported and helped me in so many ways that I don’t even know where to start. So I confine myself to thanking him from the bottom of my heart for loving me over these years.
