SHORTEST SUMMARY

AIM OF THE STUDY

• To develop a robot interface to assist the elderly with their medication intake.
• To investigate whether the target group is willing to accept medication intake assistance from a robot.

MEDICATION INTAKE INTERFACE

BACKGROUND

• Medication intake can prove to be a complicated task for the elderly.
• Roughly 50% of all prescribed medication is taken incorrectly (MacLaughlin, et al., 2005).
• Simplification of this task might have beneficial effects on this group’s general health and society’s healthcare costs.
• Together with Enacer Company we developed an assistive robot for the elderly, called RITA (the Reliable Interactive Table Assistant).

DESIGN PROCESS

Interviews with caregivers
Main result:
• It is especially important to check whether the elderly actually take their medication.

Focus group of elderly
• Feedback on the clarity of the design.
• Requirements analysis.
Main result:
• Font size should be increased for optimal utility.

Interface development
• The interface was developed in HTML5.

User study
• Usability test of the interface on the touch screen.
• Subjects were asked to perform a number of tasks related to the intake of medication.
• Basic task: supervision of medication intake.
• More advanced functions: change settings.
• Acceptance questionnaire.

RECOMMENDATIONS

• To investigate whether the target group is willing to accept medication intake assistance from a robot.
• Acceptance questionnaires.

MAIN RESULTS OF USER STUDY

Usability test
• The majority of participants in this study (17 out of 19) were able to take their medication with assistance of the interface.
• Participants found it difficult to work with more advanced interface settings.
• Setting notifications interval.
• Changing pharmacy’s contact details.
• Post-Study Usability Questionnaire (Likert 5-point scale).
• Users rated usability positively.
• Mean score of 3.9 (between ‘neutral’ and ‘agree’).

Robot Acceptance
• Robot Acceptance Questionnaire (Likert 5-point scale).
• User accepted help from the robot.
• Mean score of 3.5 (‘neutral’).

CONCLUSIONS & RECOMMENDATIONS

Conclusion
• The basic functionality of the interface was easy to use for the elderly for assistance with the medication intake task.

Recommendations
• Interfaces for the elderly should really be as simple as possible.
• Testing of usability aspects during the design process is vital for a well-designed robot.
