Morpho-syntactic cues for distributivity in Serbian
Ana Bosnić
University of Groningen/University of Nantes

Background

1. Three clowns are holding two presents.

1a. Collective

1b. Distributive

• English and Serbian acceptances rates are significantly different:

Serbian morphological system is more complex than English.
Serbian children acquire distributive markers much later (age 8-9).

• Serbian has several types of numerals and it shows a subject-verb agreement mismatch in environments with numerically quantified expressions. These factors may account for the disparity in English and Serbian child and adult results.

2. Serbian mismatch

Paucals (numerals 2.3 and 4) + paucal case 2. Tri klovna vs. *Tri klovna Three. pauc clown.pauc (sg.gen) vs *Three.pauc clown.pl.gen

Collective (mixed gender) + plural case 3. Troje dece vs *Troje deteta Three.mixed child.pl.gen vs *Three.mixed child.sg.gen (pauc)

Paucals and mixed-gender numerals show verbal agreement mismatch (allow both sg and pl): 4. Troje dece drži/drže kutiju.

Three.mixed children.gen.pl hold.sg /hold.pl box.acc “Three children are holding a box.”

Naturalness study

5. Discussion

1) Adults understand numerically quantified sentences without distributive markers as scalar/conversational implicatures.

• Since there is a better alternative to convey a distributive message (using each), or in the case of Serbian – a distributive marker po, numerically quantified sentences must be collective. (Pagliarini et al, 2012)

2) Some children had a problem to interpret singular indefinite objects as conceptually plural. This was a motivation to reject distributive pictures in the Paucl experiment, which contrasts current empirical and theoretical data.

Future work:

• Hypothesis: complex morpho-syntactic system of Serbian is loading children’s working memory, and it is affecting the processing of such ambiguous sentences.

• Proposed test: unloading the working memory will change children’s choices and make them more adult-like.

• Following Van Rij et al, (2009) – slowed-down speech rate

3) How, and to what degree, do subject-verb agreement mismatches influence Serbian interpretation preferences of numerically quantified sentences?

Methods

Two Truth Value Judgment Task

2x2 study, 24 items & 24 control items x 4 lists, balanced design

4) Results

Paucal experiment:

Mixed-gender experiment:

38 Serbian non-linguist adults (MA: 26.9) and 25 native Serbian children (MA: 7.6)

32 Serbian non-linguist adults (MA: 25.1) and 24 native Serbian children (MA: 7.7)

• The factors tested were the influence of Number (singular and plural verbal agreement) and Collective/Distributive Interpretations.

• General observations from the models are that adults are significantly less likely to choose distributive pictures matched with either singular (sg) or plural (pl) verb than children, and less likely to choose singular verbal agreement.

• Neither experiment showed significant correlations between verbal agreement and collective/distributive interpretations.
