Is the ‘cognitive revolution’ a myth?

Sandy Hobbs thinks the term is inaccurate and unhelpful; Jeremy Trevelyan Burman disagrees.

Sandy Hobbs

The term ‘revolution’ implies the dramatic overthrow of something previously dominant, either political (e.g. Russian) or intellectual (e.g. Copernican). The ‘cognitive revolution’ refers to the overthrow of behaviourism, which supposedly dominated psychology in the early 20th century, during which time the study of cognitive processes was largely ignored. This is historically false.

Although behaviourism had many supporters from the 1920s onwards, other approaches (e.g. gestalt and psychoanalysis) flourished alongside it. It was not a monolithic movement: witness the rival learning theories of Guthrie, Tolman and Hull. Lovie (1983) and Dewsbury (2000) show that research on attention and animal cognition was common at the time. It is true that since the 1950s many psychologists see themselves as ‘cognitivists’, but this cannot reasonably be called a ‘revolution’. There continue to be different theoretical perspectives that flourish side by side within psychology. The most relevant ‘non-cognitivist’ approach in this context is radical behaviourism, a movement that has grown since the 1950s, the very time the cognitive revolution supposedly took place. Radical behaviourists exist in relative isolation from other psychological approaches. For example, there is little cross-referencing (Coleman & Melhman, 1992).

Leahey (1992) has called the revolutions in American psychology ‘mythical’. Why do some psychologists spread myths about their own subject? I can offer a couple of hypotheses. Many of us would like an agreed unified paradigm for research and theorising in psychology. This has not happened, but to refer to a ‘cognitive revolution’ may allow proponents of cognitivism to pretend that theirs is such a paradigm. Some people have original myths that account for the existence of their particular tribe. Samelson (1986) argued that to present Comte as the founder of social psychology was such an origin myth. Perhaps the notion of a cognitive revolution is an origin myth too.

Jeremy Burman

There is a distinguished and eminently worthy tradition in the history of psychology of correcting falsehoods, exaggerations, and myths. Indeed, in my own area, one of the most important examples of this ‘debunking’ rebuts the 10 errors most commonly found in readings of Jean Piaget’s theory of developmental stages (Lourenço & Machado, 1996). But in making claims of ‘correction’ it is one thing to point to a mistranslation or a neglected text. It is quite another to argue the inexistence of a complex social movement.

In making this case, Sandy Hobbs uses terms like ‘historically false’, ‘flourished’ and ‘origin myth’. More than a problem of semantics, the kind of thinking typically associated with such language can be historically problematic. In complex cases, it is often associated with the premature articulation of a conclusion; anticipating a body of evidence rarely explored in sufficient depth or detail. The frame it provides also biases the subsequent discussion toward an overly simplistic question. In this case: Do you believe that there was a cognitive revolution, or not?

It is certainly the case that a body of critical work supports the ‘no revolution’ hypothesis. As Hobbs notes, Leahey (1992) did conclude – on the basis of an analysis of the meaning of Kuhn’s term ‘scientific revolution’ (Kuhn, 1962/1993, 1987/2000) – that no such thing had occurred in psychology. A citation analysis conducted by Friman et al. (1993) then supported this conclusion, as did a more recent philosophical examination by O’Donohue et al. (2003).

Nevertheless, many authors of similar persuasion have argued that something definitely did happen, whether ‘whatever it was’ meets Kuhn’s criteria or not. For example: Greenwood (1999) concluded that the change we label ‘a revolution’ occurred as a result of the replacement of operationalised variables (behaviourist descriptions) with hypothetical constructs (cognitive causes). Mandler (2002) suggested that ‘the revolution’ was really ‘a return’ to pre-behaviourist attitudes and trends, supported by imports from Germany, Britain, France and Switzerland (including Piaget).

Of course, none of this addresses the underlying historiographical issues. It merely shows that the question itself is more complicated than one of bipolar belief: there is no ‘yes’ or ‘no’ answer. And although we cannot omit findings simply because they are inconvenient, we certainly can hope that – contrary to Hobbs’s suggestion – there is more to the cognitivist position than the unifying cry, ‘With us or against us!’
Sandy Hobbs

I began my argument by stating what I took to be the normal meaning of the term ‘revolution’, then made a case for the view that it was an inappropriate word to apply to the history of 20th-century psychology. Jeremy Burman does not deal with the term ‘revolution’ but instead objects to other phrases I use, ‘historically false’, ‘flourished’, ‘origin myth’. Historically false I employed to describe the belief that behaviourism for a time dominated psychology and cognitive processes were ignored. He does not counter the evidence I cited and indeed cites additional evidence in favour of my case. Flourished I applied to the development of radical behaviourism since the 1950s. Burman offers no evidence to the contrary. Origin myth I offered as a hypothesis, asking whether the position of cognitive psychology might be analogous to the widespread misapprehension about the origins of social psychology. It may not be, but Burman does not provide any countergargument. His response is the vague phrase ‘something definitely did happen’. However, he does not explain why it is appropriate to call that ‘something’ a revolution.

Jeremy Burman

The evidence does indeed seem to support the re-examination of histories celebrating the ‘cognitive revolution’. However, the ‘no revolution’ position runs contrary to the prevailing viewpoint. Therefore, in the resulting debate, explaining our collective and continuing ignorance requires more than a hypothesis supported by an appeal to authority.

In the study of history, there is a pejorative term for inadequately supported contrarian conjecture: ‘negationist revisionism’. The distinction between this and the ‘good kind of revisionism’ (which I previously called ‘debunking’) relates ultimately to the treatment and reporting of evidence. This point was made powerfully in Denying History, published in 2000 by Michael Shermer and Alex Grobman:

...real revision – the modification of history based on new facts or new interpretations of old facts – is not only a legitimate activity of historians’ profession, it is a necessary tool… The prevailing viewpoint on any historical topic, including the origins of Western philosophy, can be questioned and plausibly revised when the participating scholars play by the rules of science, logic, and reason. That is, as long as scholars put their claims forward as testable hypotheses, then those hypotheses can be weighed against the evidence and accepted or rejected in relation to other interpretations. (p.238) The key question, moving forward, is how to do that in this case.

Sandy Hobbs

For over 30 years, I have advocated precision and caution in debate (e.g. Cornwell & Hobbs, 1976; Cornwell & Hobbs, 1984; Hobbs, 2002; Hobbs & Chiesa, 2003; Hobbs & McKechnie, 2007), so I should be upset to find myself described as ‘debunking’ and engaged in ‘negationist revisionism’. However, Burman’s treatment of me as a ‘contrarian’ is based on his unsubstantiated assumption that my views conflict with a ‘majority’. What population does he have in mind? How did he classify their opinions?

In any case, I would prefer if Burman were to deal with the specifics of my case rather than subject my position to broad and vague generalisations. He does not seem to grasp that I am arguing that the phrase ‘cognitive revolution’ is inappropriate and misleading. To aid clarification I shall restate my case in separate points which I invite him to answer one by one.

A. The term ‘revolution’ implies the overthrow of a regime.

B. ‘Cognitive revolution’ implies the overthrow of a hegemonic behaviourism.

C. Behaviourism was never dominant in psychology to the exclusion of other perspectives.

D. Cognitive issues were never excluded from mainstream psychology.

E. The term ‘cognitive revolution’ is thus inappropriate.

In the paper that drew me into this...
discussion (Chiesa & Hobbs, 2008), we argued that 'Hawthorne effect' does not help to increase our understanding of social interaction. Similarly, I suggest that Burman would be more likely to clarify the 'something' to which he applies the term 'cognitive revolution', if he were to study it without the distraction of such an inappropriate label.

Jeremy Burman
Although the burden of supporting the 'strong claim' was his, let's conclude the debate simply by doing as Hobbs suggests.

Points A and B. These are unnecessary. 'Revolution' already has a meaning for debates regarding the cognitive revolution, supplied by readings of Thomas Kuhn’s early work. The histories I reviewed earlier argued – supporting Hobbs’ argument – that this particular case does not meet the criteria necessary for a Kuhnian revolution. So what's the problem?

Point C. In North America, contrary to Hobbs’ assertion, behaviourism was indeed dominant. As George Miller explained in an interview with Bernard Baars: 'The power, the honors, the authority, the textbooks, the money, everything in psychology was owned by the behaviorist school' (Baars, 1986, p.203). That there were other approaches that existed alongside the behaviourist is relevant only if one takes an exclusionary Kuhnian (paradigmatic) perspective. The desire to preserve the problematic term – 'cognitive revolution' – is therefore not a reflection of behaviourisms provisioning psychology with a scientific paradigm, followed by its replacement, but of behaviourism’s lost dominance in the material support of psychology as a profession. (There is a vast, and still-growing, literature on what it means to be a 'profession'. Goldstein, 1984, outlined a particularly promising approach.) From the North American perspective, therefore, Hobbs’ proposal that no such shift in resources occurred is contrarian; the resulting history, revisionist. But I accept that this may not be so in Europe (see, for example, Baars, 1986, p.259).

Point D. Under behaviourism, whatever it is that happens between stimulus and response was black boxed. During the 'revolution', however, these phenomena came to be associated with 'the cognitive' (Green, 1996). Yet the recognition of the importance of explaining behaviour was not unique to North America.

In Europe, for example, Piaget attempted – in collaboration with Daniel Berlyne – to bridge the gap between behaviourism and what became the cognitive approach (Berlyne & Piaget, 1966). Piaget’s group’s later forays into cybernetics, similarly, sought to produce a functional model of learning that would be consistent with both perspectives (Cellérier et al., 1968). Their synthesis was then later re-imported to America, via Seymour Papert’s influence at MIT, and itself became the dominant approach in research on artificial intelligence until the late-1980s (see Boden, 2006, pp.912–916).

Hobbs’s point E must therefore be rephrased and made more specific: the term 'cognitive revolution' is indeed inappropriate in describing a global phenomenon (cf. Brock, 2006). But such labels can be usefully applied in specific regions where different national psychologies have followed their own developmental pathways. In cases where perspectives from ‘foreign’ national psychologies were imported, issues of translation – not only of language, but also of context and intent (i.e. matters of implication) – must be considered in examining the contents of any resulting change.

Contrary to Hobbs’s basic premise, therefore, the term ‘revolution’ itself can indeed be useful. Insofar as it draws attention to a shift in the dominant meta-theory guiding what it meant to ‘do science’ in a specific place and time, and thus highlights shifts in implication for would-be translators (and interpreters) of the meanings of the results of that science, it can serve as a helpful signpost. Its use also affords opportunities for doing histories of the discipline (e.g. social and institutional histories, analyses of influence, the search for invisible colleges, etc.), rather than just histories of psychological facts discovered in a social and political vacuum.

A double date from the UKCP diary

Two major autumn conferences

**UKCP Psychotherapy with Children Conference**
3–4 October 2009
Queens Hotel, Leeds

**UKCP Diversity and Equalities, and Ethics committees**
13 November 2009 – 9.30am to 5pm
Magic Circle, London

---

**Changing Children’s Lives**

_‘We can be kings and queens in castles of gold…’_

Keynote speakers:

- **Sue Gerhardt** – Why love matters… to clinicians
- **Dr Sami Timmi** – Challenging the medicalisation of childhood – what does the evidence say?
- **Camila Batmanghelidjh** – Real psychotherapy in real transient spaces: a bus stop, a crack den, a dodgy greasy spoon café – anywhere that works

Our conference is open to those interested in the emotional and mental wellbeing of children, young people and families. It will also be of interest to therapists working with adults and for supervisors.

We have keynotes speakers at the cutting edge of this field and well-known workshop presenters. Topics are wide ranging covering a breadth and depth of themes. Our conference will be stimulating and lively with lots of opportunities for networking, exploration and learning.

---

**Do no harm? Challenges in engaging the ethics of diversity**

Keynote Speakers:

- **Zenobia Nadirshaw** – Equality and diversity: A race against time
- **Frank Lowe** – Race, a no go area: the unanalysed race complex and its implications for training organisations, psychotherapists and their patients
- **Derek Mowbray** – The case of Emmanuel Smith – all dressed up and nowhere to go

Working across the diversity of our clients often presents even greater challenges to our ability to respond sensitively and appropriately to the multiple differences of age, gender, sexual orientation, race, culture, ethnicity, disability, class, language and religion/spirituality.
