Experimental procedure for fabrication of solar cells

PF10TBT:fullerene solutions were prepared by dissolving 3 mg/mL PF10TBT and 12 mg/mL fullerenes in chlorobenzene at 90 °C. Devices were prepared on ITO coated glass substrates. The substrates were scrubbed with soap, put in a flow bath with deionized water, sonicated in acetone, rinsed with deionized water, sonicated in 2-isopropanol, spun dry, dried at 140 °C in an oven and received UV-ozone treatment for 20 minutes. A 50 nm layer of PEDOT:PSS (CLEVIOS P VP AI 4083) was applied as anode buffer layer. The active layers were spin cast at elevated temperature (90 °C) on top of the PEDOT:PSS layer. One nm of lithium fluoride and 100 nm of aluminium were used as cathode for all devices. Multiple sets of devices were prepared. One with 1:4 weight ratios of polymer and fullerene and one with altered ratios to take into account the differences in molecular weights of the fullerenes. Across both sets the open-circuit voltages are consistently higher for the FCBM devices in comparison to the PCBM devices. Figure 1 illustrates this fact. Illumination was done with a Steuernagel Solar Constant 1200 metal halide lamp. The lamp was calibrated with a silicon reference device and corrected for spectral mismatch with the AM1.5G spectrum by means of the spectral response. Electrical characterization was done with a Keithley Source Meter 2400. Spectral response measurements were done with a custom setup using a quartz tungsten halogen source, calibrated with a silicon photodiode. Halogen lights were used to provide white bias lighting on the cells. IPCE measurements for devices with equal weight ratios are shown in figure 2. Data points represent an average over four devices on one substrate ranging from 9 mm² to 1 cm². The error bars represent the typical spread in spectral response over these four devices.

**Figure S2.** IPCE measurements of PF10TBT:fullerene solar cells. Averages over four devices on one substrate are taken. The error bars represent the spread in response for these devices, ranging from 9 mm² to 1 cm².
General

All reagents and solvents were purchased from Aldrich or Acros and used as received or purified using standard procedures. [60] Fullerene (99.5%) was purchased from Solenne BV and BuckyUSA and was used without further purification. Column chromatography was performed using silica gel (Aldrich 60, 230-240 mesh). Melting points were determined with a Mettler FP1 melting point apparatus equipped with a Mettler FP2 microscope. $^1$H NMR and $^{13}$C NMR were recorded on a Varian Unity Plus (500 MHz), on a Varian AMX400 (400 MHz) or a Varian VXR-200 (200 MHz) instrument as indicated in the specifications, at 298 K. Chemical shifts are donated in $\delta$ values (ppm) relative to TMS. FT-IR measurements were performed on a Nicolette Nexus FT-IR instrument. High Resolution Mass Spectroscopy (HRMS) was performed on a JEOL JMS 600 spectrometer. HPLC-MS analyses were performed on a Hewlett Packard Chemstation Agilent 1100 Series using an analytical Cosmosil Buckyprep Waters Type column (4.6 x 250 mm). Cyclic voltammetry was performed using an Autolab PGStat 100. All reactions were carried out in flame-dried glassware under an N$_2$-atmosphere.

9,9-dihexyl-9H-fluorene (1): A suspension of fluorene (4.0 g, 24 mmol) and potassium hydroxide (13.0 g, 240 mmol, 10 eq.) in dimethyl sulfoxide (40 ml) was stirred at room temperature for 10 minutes and 1-bromo-octane (9.9 g, 60 mmol, 2.5 eq.) was added using a syringe. The mixture was heated to 60°C and stirred for 5 days. The mixture was poured into water (100 ml) and extracted with ethyl acetate (3x 100 ml). 9,9-dihexyl-9H-fluoren-2-yl-C₆₁-butyric-acid methylester (10): A mixture of 9,9-dihexyl-9H-fluoren-2-yl-methylbutyrate-p-tosylhydrazone 7 (400 mg, 0.64 mmol, 1.1 eq.) and sodium methoxide (36 mg, 0.66 mmol, 1.1 eq.) was dissolved in dry pyridine (10 ml) and stirred at room temperature for 30 minutes. Then a degassed solution of C₆₀ (427 mg, 0.59 mmol) in ortho-dichlorobenzene (50 ml) was added. The mixture was heated to 90°C and irradiated with a 150 W Na-lamp. The solution was concentrated in vacuo after reacting overnight. The product was purified on a SiO₂ column. The unreacted C₆₀ was eluted with CS₂ and then the product with a 1:1 mixture of toluene and cyclohexane. After removal of the eluent in vacuo a dark solid remained. The solid was precipitated from ortho-dichlorobenzene in methanol and subsequently centrifuged. The remaining brown pellet was washed twice with methanol and dried in vacuo at 40°C overnight. Yielding 361 mg (0.3 mmol, 52%) of the product as a brown solid. Crystallographic data

The position of the electrophilic substitution on the fluorene moiety was confirmed by x-ray crystal structure. Suitable crystals of the hexyl-substituted tosylhydrazone (7) were obtained by recrystallization from a pentane/methanol mixture. The crystal structure shows that the fluorene was acylated at the 2-position (C14).
